## The Blackbody problem

Emission by a small hole in a heated oven. What is known at Planck's time.

- The radiation is universal
- Stefan's law

$$
\begin{equation*}
\mathcal{P}=\sigma S T^{4} \tag{1}
\end{equation*}
$$

where $\sigma=5.6710^{-8} \mathrm{~W} / \mathrm{m}^{2} \mathrm{~K}^{4}$

- Lambert's law

$$
\begin{equation*}
d \mathcal{P}=L S \cos \theta d \Omega \tag{2}
\end{equation*}
$$

where the luminance $L$ is related to the total density of energy in the oven $u=\int u_{\nu} d \nu$, by:

$$
\begin{align*}
L & =\frac{c u}{4 \pi}  \tag{3}\\
\mathcal{P} & =\frac{c S u}{4} \tag{4}
\end{align*}
$$

and

$$
\begin{equation*}
u=\frac{4}{c} \sigma T^{4} \tag{5}
\end{equation*}
$$

## The Blackbody problem

Emission by a small hole in a heated oven. What is known at Planck's time?

- Wien's displacement law

$$
\begin{equation*}
u_{\nu}=\nu^{3} f\left(\frac{\nu}{T}\right) \tag{6}
\end{equation*}
$$

- Wien's phenomenological model

$$
\begin{equation*}
u_{v}=\alpha \nu^{3} e^{-\gamma \nu / T} \tag{7}
\end{equation*}
$$

- And many precise measurements of the spectrum (pyrometry).

## The Blackbody problem

## Counting the modes

Assume a rectangular volume for the oven, with periodic boundary conditions. Support only plane waves with $\mathbf{k}=\left(k_{x}, k_{y}, k_{z}\right)$ so that

$$
\begin{equation*}
k_{x}=\frac{2 \pi}{L_{x}} n_{x} \tag{8}
\end{equation*}
$$

where $n_{x, y, z}$ is a set of three positive or negative integers. Two orthogonal polarizations for each set of integers. Energies of all these 'modes' add up independently (detailed justification later).
$N_{\nu}$ the total number of modes $k<2 \pi \nu / c$. Number of modes per unit volume between $\nu$ and $\nu+d \nu: \rho_{\nu} d \nu$

$$
\begin{equation*}
\rho_{\nu}=\frac{1}{\mathcal{V}} \frac{d N_{\nu}}{d \nu} \tag{9}
\end{equation*}
$$

## The Blackbody problem

Counting the modes

Counting the modes with a frequency lower than $\nu$ amounts to counting twice the number of points with integer coordinates in a sphere of radius $2 \pi \nu / c$ :

$$
\begin{equation*}
N_{\nu}=2 \frac{\frac{4 \pi}{3}\left(\frac{2 \pi \nu}{c}\right)^{2}}{\frac{8 \pi^{3}}{\mathcal{V}}}=\frac{8 \pi}{3} \frac{\nu^{3}}{c^{3}} \mathcal{V} \tag{10}
\end{equation*}
$$

where $\mathcal{V}$ is the box volume. Hence

$$
\begin{equation*}
\rho_{\nu}=\frac{8 \pi}{c^{3}} \nu^{2} \tag{11}
\end{equation*}
$$

## The Blackbody problem

Rayleigh Jeans argument

Attribute the average thermal energy $k_{b} T$ to each mode

$$
\begin{equation*}
u_{\nu}=k_{b} T \rho_{\nu} \tag{12}
\end{equation*}
$$

- Fits with observation at low frequency
- Absurd at high frequencies: divergence of the spectrum and infinite power
Classical statistical physics fails at explaining the blackbody radiation!

## The Blackbody problem

Planck's argument

The light quantum
Planck's hypothesis
The exchanges of energy between field and matter occur as multiples of a fundamental quantum

$$
\begin{equation*}
h \nu \tag{13}
\end{equation*}
$$

where $h$ is a 'Hilfeconstant'. Hence $E=n h \nu$.
Average energy per mode (standard statistical physics)

$$
\begin{equation*}
\bar{E}=h \nu \frac{\sum_{n=0}^{\infty} n e^{-n h \nu / k_{b} T}}{\sum_{n=0}^{\infty} e^{-n h \nu / k_{b} T}} \tag{14}
\end{equation*}
$$

## The Blackbody problem

Planck's argument
With $\beta=1 / k_{b} T$ and $\chi=\beta h \nu$, we note that
$\sum \exp (-\chi n)=1 /[1-\exp (-\chi)]$ and
$\sum n \exp (-\chi n)=-(d / d \chi) 1 /[1-\exp (-\chi)]=\exp (-\chi) /[1-\exp (-\chi)]^{2}$

$$
\begin{equation*}
\bar{E}=h \nu \bar{n}=h \nu \frac{1}{e^{\chi}-1} \tag{15}
\end{equation*}
$$

We finally get the Planck's law:

$$
\begin{equation*}
u_{\nu}=\frac{8 \pi h \nu^{3}}{c^{3}} \frac{1}{e^{h \nu / k_{b} T}-1} \tag{16}
\end{equation*}
$$

In excellent agreement with experiments if

$$
\begin{equation*}
h=6.6210^{-34} \mathrm{~J} / \mathrm{s} \tag{17}
\end{equation*}
$$

## The Blackbody problem

## Limits

- For small frequencies: Rayleigh Jeans

$$
\begin{equation*}
u_{\nu}=\frac{8 \pi \nu^{2}}{c^{3}} k_{b} T \tag{18}
\end{equation*}
$$

the classical predictions without field quantization (many photons per mode).

- For large frequencies: phenomenological Wien's law

$$
\begin{equation*}
u_{\nu}=\frac{8 \pi h \nu^{3}}{c^{3}} e^{-h \nu / k_{b} T} \tag{19}
\end{equation*}
$$

- Explicit expression of Stefan's constant

$$
\begin{equation*}
\sigma=\frac{2 \pi^{5}}{15} \frac{k_{b}^{4}}{c^{2} h^{3}} \tag{20}
\end{equation*}
$$

## The Blackbody problem

## Einstein 1905

A more solid justification of the heuristic Plank's hypothesis. Starting point

$$
\begin{equation*}
u_{\nu}=\alpha \nu^{3} e^{-h \nu / k_{b} T}=\alpha \nu^{3} e^{-\gamma \nu T} \tag{21}
\end{equation*}
$$

with $\gamma=h / k_{b}$. This leads by a simple inversion to:

$$
\begin{equation*}
T=-\frac{\gamma \nu}{\ln u_{\nu} / \alpha \nu^{3}} \tag{22}
\end{equation*}
$$

Density of entropy $s, d s / d u=1 / T$ and, by integration over $u$

$$
\begin{align*}
s & =-\int_{0}^{\infty} d u^{\prime} \frac{\ln u^{\prime} / \alpha \nu^{3}}{\gamma \nu} \\
& =-\frac{u}{\gamma \nu}\left[\ln \frac{u}{\alpha \nu^{3}}-1\right] \tag{23}
\end{align*}
$$

## The Blackbody problem

## Einstein 1905

Total entropy in volume $\mathcal{V}, S=s \mathcal{V}$, and total energy $E=u \mathcal{V}$ linked by

$$
\begin{equation*}
S=-\frac{E}{\gamma \nu}\left[\ln \frac{E}{\mathcal{V} \alpha \nu^{3}}-1\right] \tag{24}
\end{equation*}
$$

$S_{0}$ the entropy for the volume $\mathcal{V}_{0}$

$$
\begin{equation*}
S-S_{0}=\frac{E}{\gamma \nu} \ln \frac{\mathcal{V}}{\mathcal{V}_{0}} \tag{25}
\end{equation*}
$$

Compare to the entropy variation of a perfect gas in an isothermal compression

$$
\begin{equation*}
S-S_{0}=k_{b} N \ln \frac{\mathcal{V}}{\mathcal{V}_{0}} \tag{26}
\end{equation*}
$$

where $N$ is the total number of particles. $N k_{b}=E k_{b} / h \nu$ and $E / N=h \nu$.

## Objective

To quantify the field, we must identify a set of orthogonal modes, the relevant dynamical variables and quantify them according to the 'canonical' quantization procedure. The main technical difficulty in field quantization is thus a classical electromagnetism calculation.

## Eigenmodes

Positive frequency fields
Time Fourier transform of electric field

$$
\begin{equation*}
\mathbf{E}(\mathbf{r}, t)=\frac{1}{\sqrt{2 \pi}} \int_{-\infty}^{\infty} \widetilde{\mathbf{E}}(\mathbf{r}, \omega) e^{-i \omega t} d \omega \tag{27}
\end{equation*}
$$

Since $\mathbf{E}$ is a real field,

$$
\begin{equation*}
\widetilde{\mathbf{E}}^{*}(\mathbf{r}, \omega)=\widetilde{\mathbf{E}}(\mathbf{r},-\omega) \tag{28}
\end{equation*}
$$

Define the 'positive frequency field'

$$
\begin{equation*}
\mathbf{E}^{+}(\mathbf{r}, t)=\frac{1}{\sqrt{2 \pi}} \int_{0}^{\infty} \widetilde{\mathbf{E}}(\mathbf{r}, \omega) e^{-i \omega t} d \omega \tag{29}
\end{equation*}
$$

and the 'negative frequency field'

$$
\begin{equation*}
\mathbf{E}^{-}(\mathbf{r}, t)=\frac{1}{\sqrt{2 \pi}} \int_{-\infty}^{0} \widetilde{\mathbf{E}}(\mathbf{r}, \omega) e^{-i \omega t} d \omega=\left(\mathbf{E}^{+}(\mathbf{r}, t)\right)^{*} \tag{30}
\end{equation*}
$$

Hence

$$
\begin{equation*}
\mathbf{E}(\mathbf{r}, t)=\mathbf{E}^{+}(\mathbf{r}, t)+\mathbf{E}^{-}(\mathbf{r}, t) \tag{31}
\end{equation*}
$$

## Eigenmodes

Eigenmodes basis
'Box' of limiting conditions with a total volume $\mathcal{V}$. Orthogonal basis for the solutions of Maxwell equations (a Hilbert space)

$$
\begin{equation*}
\mathbf{f}_{\ell}(\mathbf{r}) e^{-i \omega_{\ell} t} \tag{32}
\end{equation*}
$$

where the dimensionless amplitude $\mathbf{f}_{\ell}$ is divergence-free and obeys the Helmholtz equation:

$$
\begin{equation*}
\Delta \mathbf{f}_{\ell}+\frac{\omega_{\ell}^{2}}{c^{2}} \mathbf{f}_{\ell}=0 \tag{33}
\end{equation*}
$$

Orthogonality:

$$
\begin{equation*}
\int_{\mathcal{V}} d^{3} \mathbf{r} \mathbf{f}_{\ell}^{*}(\mathbf{r}) \cdot \mathbf{f}_{\ell^{\prime}}(\mathbf{r})=\delta_{\ell, \ell^{\prime}} \mathcal{V} \tag{34}
\end{equation*}
$$

Normalization:

$$
\begin{equation*}
\int_{\mathcal{V}} d^{3} \mathbf{r}\left|\mathbf{f}_{\ell}(\mathbf{r})\right|^{2}=\mathcal{V} \tag{35}
\end{equation*}
$$

## Eigenmodes

Eigenmodes basis
Expand the positive frequency field on this basis

$$
\begin{equation*}
\mathbf{E}^{+}(\mathbf{r}, t)=\sum_{\ell} \mathcal{E}_{\ell}(t) \mathbf{f}_{\ell}(\mathbf{r}) \tag{36}
\end{equation*}
$$

where

$$
\begin{equation*}
\mathcal{E}_{\ell}(t)=\frac{1}{\mathcal{V}} \int \mathbf{E}^{+}(\mathbf{r}, t) \cdot \mathbf{f}_{\ell}^{*}(\mathbf{r}) d^{3} \mathbf{r} \tag{37}
\end{equation*}
$$

The amplitude is obviously a harmonic function of time

$$
\begin{equation*}
\mathcal{E}_{\ell}(t)=\mathcal{E}_{\ell}(0) e^{-i \omega_{\ell} t} \tag{38}
\end{equation*}
$$

Finally

$$
\begin{equation*}
\mathbf{E}^{+}(\mathbf{r}, t)=\sum_{\ell} \mathcal{E}_{\ell}(0) e^{-i \omega_{\ell} t} \mathbf{f}_{\ell}(\mathbf{r}) \tag{39}
\end{equation*}
$$

## Eigenmodes

## Plane-wave basis

- A simple basis for a rectangular box and periodic boundaries.
- Set of plane waves with $\mathbf{k}_{\mathbf{n}}=\left(k_{x}, k_{y}, k_{z}\right)=\left(n_{x} 2 \pi / L_{x}, n_{y} 2 \pi / L_{y}, n_{z} 2 \pi / L_{z}\right)$, where the $n$ s are positive or negative.
- For each $\mathbf{n}=\left(n_{x}, n_{y}, n_{z}\right)$, two orthogonal linear polarizations $\epsilon_{1}$ and $\epsilon_{2}$, perpendicular to $\mathbf{k}: \epsilon_{1} \times \epsilon_{2}=\mathbf{u}_{\mathbf{k}}$.
- Basis

$$
\begin{equation*}
\mathbf{f}_{\ell}(\mathbf{r})=\boldsymbol{\epsilon}_{\ell} e^{i \mathbf{k}_{\ell} \cdot \mathbf{r}} \tag{40}
\end{equation*}
$$

with $\ell=\left(n_{x}, n_{y}, n_{z}, \epsilon\right)$

- Circular polarization basis

$$
\begin{gather*}
\epsilon_{ \pm}=\frac{\epsilon_{1} \pm i \epsilon_{2}}{\sqrt{2}}  \tag{41}\\
\epsilon_{+} \times \epsilon_{-}=-i \mathbf{u}_{\mathrm{k}} \tag{42}
\end{gather*}
$$

## Eigenmodes

Mode basis change

Two sets of modes $\mathbf{f}_{\ell}$ and $\mathbf{g}_{p}$ checking the same limiting conditions

$$
\begin{equation*}
\mathbf{f}_{\ell}=\sum_{p} U_{\ell p} \mathbf{g}_{p} \tag{43}
\end{equation*}
$$

where $U_{\ell p}$ connects only modes with the same frequency.

$$
\begin{equation*}
U_{\ell p}=\frac{1}{\mathcal{V}} \int \mathbf{f}_{\ell} \cdot \mathbf{g}_{p}^{*} d^{3} \mathbf{r} \tag{44}
\end{equation*}
$$

## Eigenmodes

Mode basis change

Check that $U$ is unitary

$$
\begin{equation*}
\delta_{\ell, \ell^{\prime}}=\frac{1}{\mathcal{V}} \int \mathbf{f}_{\ell}^{*} \cdot \mathbf{f}_{\ell^{\prime}} d^{3} \mathbf{r}=\sum_{p, p^{\prime}} U_{\ell p}^{*} U_{\ell^{\prime} p^{\prime}} \frac{1}{\mathcal{V}} \int \mathbf{g}_{p}^{*} \cdot \mathbf{g}_{p^{\prime}} d^{3} \mathbf{r} \tag{45}
\end{equation*}
$$

Using the orthonormality of $\mathbf{g}$ :

$$
\begin{equation*}
\delta_{\ell, \ell^{\prime}}=\sum_{p} U_{\ell p}^{*} U_{\ell^{\prime} p}=\sum_{p} U_{\ell^{\prime} p} U_{p \ell}^{\dagger} \tag{46}
\end{equation*}
$$

and hence $\mathbb{1}=U U^{\dagger}$

## Normal variables

## Potential vector

Choose a simple set of dynamical variables. The potential vector $\mathbf{A}$ is divergence-free in the Coulomb gauge and $\mathbf{E}=-\partial \mathbf{A} / \partial t$. Can be thus expanded on the same basis as $\mathbf{E}$

$$
\begin{equation*}
\mathbf{A}^{+}(\mathbf{r}, t)=\sum_{\ell} \mathcal{A}_{\ell}(t) \mathbf{f}_{\ell}(\mathbf{r}) \tag{47}
\end{equation*}
$$

Choose the $\mathcal{A}(t)$ (harmonic functions of time) as the normal variables and separate real and imaginary parts

$$
\begin{equation*}
\mathcal{A}_{\ell}(t)=\mathcal{A}_{\ell}(0) e^{-i \omega t}=x_{\ell}(t)+i p_{\ell}(t) \tag{48}
\end{equation*}
$$

## Normal variables

All fields

From $\mathbf{E}^{+}=-\partial \mathbf{A}^{+} / \partial t$

$$
\begin{equation*}
\mathcal{E}_{\ell}(t)=-\frac{d \mathcal{A}_{\ell}}{d t}=i \omega_{\ell} \mathcal{A}_{\ell} \tag{49}
\end{equation*}
$$

and hence

$$
\begin{equation*}
\mathbf{E}^{+}(\mathbf{r}, t)=\sum_{\ell} i \omega_{\ell} \mathcal{A}_{\ell}(t) \mathbf{f}_{\ell}(\mathbf{r}) \tag{50}
\end{equation*}
$$

Magnetic field:

$$
\begin{equation*}
\mathbf{B}^{+}(\mathbf{r}, t)=\sum_{\ell} \mathcal{A}_{\ell}(t) \mathbf{h}_{\ell}(\mathbf{r}) \tag{51}
\end{equation*}
$$

where

$$
\begin{equation*}
\mathbf{h}_{\ell}(\mathbf{r})=\nabla \times \mathbf{f}_{\ell}(\mathbf{r}) \tag{52}
\end{equation*}
$$

## Field energy

The total field energy

$$
\begin{equation*}
H=\frac{\epsilon_{0}}{2} \int E^{2}+\frac{1}{2 \mu_{0}} \int B^{2} \tag{53}
\end{equation*}
$$

must be written in terms of real fields

$$
\begin{equation*}
\mathbf{E}=2 \operatorname{Re} \mathbf{E}^{+}=2 \operatorname{Re} \sum_{\ell} i \omega_{\ell} \mathcal{A}_{\ell} \mathbf{f}_{\ell} \tag{54}
\end{equation*}
$$

Taking into account the mode orthogonality

$$
\begin{equation*}
H=\sum_{\ell} H_{\ell} \tag{55}
\end{equation*}
$$

Remains to evaluate energy of one given mode. Drop index $\ell$ for the time being.

## Field energy

Electric energy

Real field

$$
\begin{equation*}
\mathbf{E}=i \omega\left[\mathcal{A} \mathbf{f}-\mathcal{A}^{*} \mathbf{f}^{*}\right] \tag{56}
\end{equation*}
$$

or

$$
\begin{equation*}
\mathbf{E}=-2 \omega\left[x \mathbf{f}^{\prime \prime}+p \mathbf{f}^{\prime}\right] \tag{57}
\end{equation*}
$$

with

$$
\begin{gather*}
\mathbf{f}=\mathbf{f}^{\prime}+i \mathbf{f}^{\prime \prime}  \tag{58}\\
H_{e}=2 \omega^{2} \epsilon_{0}\left[x^{2} \int\left(\mathbf{f}^{\prime \prime}\right)^{2}+p^{2} \int\left(\mathbf{f}^{\prime}\right)^{2}+2 x p \int \mathbf{f}^{\prime} \cdot \mathbf{f}^{\prime \prime}\right] \tag{59}
\end{gather*}
$$

## Field energy

Magnetic energy

With

$$
\begin{equation*}
\mathbf{B}=\mathcal{A} \mathbf{h}+\mathcal{A}^{*} \mathbf{h}^{*}=2 x \mathbf{h}^{\prime}-2 p \mathbf{h}^{\prime \prime} \tag{60}
\end{equation*}
$$

we get

$$
\begin{equation*}
H_{b}=\frac{2}{\mu_{0}}\left[x^{2} \int\left(\mathbf{h}^{\prime}\right)^{2}+p^{2} \int\left(\mathbf{h}^{\prime \prime}\right)^{2}-2 x p \int \mathbf{h}^{\prime} \cdot \mathbf{h}^{\prime \prime}\right] \tag{61}
\end{equation*}
$$

Similar, but not obviously equal, to the electric energy.

## Field energy

## Comparing the energies

Let us start with the integral of $\left(\mathbf{h}^{\prime}\right)^{2}$, with $\mathbf{h}=\boldsymbol{\nabla} \times \mathbf{f}$. Using

$$
\begin{equation*}
\nabla \cdot(\mathbf{a} \times \mathbf{b})=\mathbf{b} \cdot(\nabla \times \mathbf{a})-\mathbf{a} \cdot(\nabla \times \mathbf{b}) \tag{62}
\end{equation*}
$$

we can write

$$
\begin{equation*}
\nabla \cdot\left[\mathbf{f}^{\prime} \times\left(\boldsymbol{\nabla} \times \mathbf{f}^{\prime}\right)\right]=\left(\nabla \times \mathbf{f}^{\prime}\right)^{2}-\mathbf{f}^{\prime} \cdot\left(\boldsymbol{\nabla} \times \boldsymbol{\nabla} \times \mathbf{f}^{\prime}\right) \tag{63}
\end{equation*}
$$

Using that these fields are divergence-free and with Helmoltz equation:

$$
\begin{equation*}
\nabla \cdot\left[\mathbf{f}^{\prime} \times\left(\nabla \times \mathbf{f}^{\prime}\right)\right]=\left(\mathbf{h}^{\prime}\right)^{2}-\frac{\omega^{2}}{c^{2}}\left(\mathbf{f}^{\prime}\right)^{2} \tag{64}
\end{equation*}
$$

Integrating over space:

$$
\begin{equation*}
\int\left(\mathbf{h}^{\prime}\right)^{2}=\frac{\omega^{2}}{c^{2}} \int\left(\mathbf{f}^{\prime}\right)^{2} \tag{65}
\end{equation*}
$$

Similarly

$$
\begin{equation*}
\int\left(\mathbf{h}^{\prime \prime}\right)^{2}=\frac{\omega^{2}}{c^{2}} \int\left(\mathbf{f}^{\prime \prime}\right)^{2} \tag{66}
\end{equation*}
$$

## Field energy

Comparing the energies
Let us examine is $\int \mathbf{h}^{\prime} \cdot \mathbf{h}^{\prime \prime}$. With

$$
\begin{equation*}
\nabla \cdot\left[\mathbf{f}^{\prime} \times\left(\nabla \times \mathbf{f}^{\prime \prime}\right)\right]=(\nabla \times \mathbf{f}) \cdot\left(\nabla \times \mathbf{f}^{\prime \prime}\right)-\mathbf{f}^{\prime} \cdot\left(\nabla \times \nabla \times \mathbf{f}^{\prime \prime}\right) \tag{67}
\end{equation*}
$$

we get

$$
\begin{equation*}
\int \mathbf{h}^{\prime} \cdot \mathbf{h}^{\prime \prime}=\frac{\omega^{2}}{c^{2}} \int \mathbf{f}^{\prime} \cdot \mathbf{f}^{\prime \prime} \tag{68}
\end{equation*}
$$

Hence

$$
\begin{equation*}
H_{b}=2 \omega^{2} \epsilon_{0}\left[x^{2} \int\left(\mathbf{f}^{\prime}\right)^{2}+p^{2} \int\left(\mathbf{f}^{\prime \prime}\right)^{2}-2 x p \int \mathbf{f}^{\prime} \cdot \mathbf{f}^{\prime \prime}\right] \tag{69}
\end{equation*}
$$

Using

$$
\begin{equation*}
\int\left(\mathbf{f}^{\prime}\right)^{2}+\int\left(\mathbf{f}^{\prime \prime}\right)^{2}=\mathcal{V} \tag{70}
\end{equation*}
$$

we get finally

$$
\begin{equation*}
H=2 \omega^{2} \epsilon_{0} \mathcal{V}\left[x^{2}+p^{2}\right] \tag{71}
\end{equation*}
$$

## Field energy

Total field energy

The total energy of the radiation field is thus:

$$
\begin{equation*}
H=\sum_{\ell} H_{\ell}=\sum_{\ell} 2 \omega_{\ell}^{2} \epsilon_{0} \mathcal{V}\left[x_{\ell}^{2}+p_{\ell}^{2}\right] \tag{72}
\end{equation*}
$$

A collection of independent harmonic oscillators.

## Field energy

## Canonical variables

- Need canonically conjugate variables for quantization: $x_{c}$ and $p_{c}$ such that

$$
\begin{equation*}
\frac{d x_{c}}{d t}=\frac{\partial H}{\partial p_{c}} \quad \text { and } \quad \frac{d p_{c}}{d t}=-\frac{\partial H}{\partial x_{c}} \tag{73}
\end{equation*}
$$

- $x$ and $p$ are not canonical, since

$$
\begin{equation*}
\frac{d x}{d t}=\omega p \neq \frac{\partial H}{\partial p}=4 \omega^{2} \epsilon_{0} \mathcal{V} p \tag{74}
\end{equation*}
$$

- Canonical amplitude

$$
\begin{equation*}
\alpha(t)=2 \sqrt{\epsilon_{0} \omega \mathcal{V}} \mathcal{A}(t) \tag{75}
\end{equation*}
$$

- Canonical position and momentum:

$$
\begin{equation*}
\alpha(t)=x_{c}+i p_{c} \tag{76}
\end{equation*}
$$

i.e.

$$
\begin{equation*}
x_{c}=2 \sqrt{\epsilon_{0} \omega \mathcal{V}} x \quad \text { and } \quad p_{c}=2 \sqrt{\epsilon_{0} \omega \mathcal{V}} p \tag{77}
\end{equation*}
$$

## Field energy

Canonical variables

Mode energy

$$
\begin{equation*}
H=\frac{\omega}{2}\left[x_{c}^{2}+p_{c}^{2}\right] \tag{78}
\end{equation*}
$$

and obviously

$$
\begin{equation*}
\frac{d x_{c}}{d t}=\frac{\partial H}{\partial p_{c}} \quad \text { and } \quad \frac{d p_{c}}{d t}=-\frac{\partial H}{\partial x_{c}} \tag{79}
\end{equation*}
$$

Proper canonical variables. Note that the $x_{c}$ and $p_{c}$ coordinates are not dimensionless (their joint dimension is the square root of an action)

## Field momentum

## Total momentum

Density of momentum proportional to the Poynting vector

$$
\begin{equation*}
\mathbf{g}=\frac{\boldsymbol{\Pi}}{c^{2}} \quad \text { with } \quad \boldsymbol{\Pi}=\frac{\mathbf{E} \times \mathbf{B}}{\mu_{0}} \tag{80}
\end{equation*}
$$

The plane wave mode basis is most convenient to describe the momentum

$$
\begin{equation*}
\mathbf{E}^{+}(\mathbf{r}, t)=\sum_{\ell} \mathbf{E}_{\ell}^{+}=\sum_{\ell} i \omega_{\ell} \mathcal{A}_{\ell}(t) \boldsymbol{\epsilon}_{\ell} e^{i \mathbf{k}_{\ell} \cdot \mathbf{r}} \tag{81}
\end{equation*}
$$

and

$$
\begin{equation*}
\mathbf{B}^{+}(\mathbf{r}, t)=\sum_{\ell} \mathbf{B}_{\ell}^{+}=\sum_{\ell} \mathcal{A}_{\ell}(t)\left(i \mathbf{k}_{\ell} \times \boldsymbol{\epsilon}_{\ell}\right) e^{i \mathbf{k}_{\ell} \cdot \mathbf{r}} \tag{82}
\end{equation*}
$$

## Field momentum

Total momentum
Using orthogonalities of modes and polarizations

$$
\begin{equation*}
\mathbf{P}=\sum_{\ell} \mathbf{P}_{\ell} \tag{83}
\end{equation*}
$$

with

$$
\begin{equation*}
\mathbf{P}_{\ell}=\epsilon_{0} \int\left(\mathbf{E}_{\ell}^{+}+\mathbf{E}_{\ell}^{-}\right) \times\left(\mathbf{B}_{\ell}^{+}+\mathbf{B}_{\ell}^{-}\right) \tag{84}
\end{equation*}
$$

and after a painful calculation

$$
\begin{equation*}
\mathbf{P}_{\ell}=2 \epsilon_{0} \mathcal{V} \omega_{\ell}\left|\mathcal{A}_{\ell}\right|^{2} \boldsymbol{\epsilon}_{\ell} \times\left(\mathbf{k}_{\ell} \times \boldsymbol{\epsilon}_{\ell}\right) \tag{85}
\end{equation*}
$$

or, finally

$$
\begin{equation*}
\mathbf{P}=\frac{1}{2} \sum_{\ell}\left|\alpha_{\ell}\right|^{2} \mathbf{k}_{\ell} \tag{86}
\end{equation*}
$$

with a clear interpretation.

## Field momentum

Angular momentum
Angular momentum density $\mathbf{r} \times \mathbf{g}$ and hence

$$
\begin{equation*}
\mathbf{J}=\epsilon_{0} \int \mathbf{r} \times(\mathbf{E} \times \mathbf{B}) d^{3} \mathbf{r} \tag{87}
\end{equation*}
$$

A difficult calculation leads to

$$
\begin{equation*}
\mathbf{J}=\mathbf{L}+\mathbf{S} \tag{88}
\end{equation*}
$$

where

$$
\begin{equation*}
\mathbf{S}=\epsilon_{0} \int \mathbf{E} \times \mathbf{A} d^{3} \mathbf{r} \tag{89}
\end{equation*}
$$

is the field's 'intrinsic angular momentum' and

$$
\begin{equation*}
\mathbf{L}=\epsilon_{0} \int d^{3} \mathbf{r} \sum_{j} E_{j}(\mathbf{r} \cdot \nabla) A_{j}, \quad j=(x, y, z) \tag{90}
\end{equation*}
$$

is the field's 'orbital angular momentum'.

## Field momentum

Spin angular momentum

Plane wave basis with circular polarizations

$$
\begin{equation*}
\mathbf{S}=i \epsilon_{0} \mathcal{V} \sum_{n} \omega_{n}\left[\mathcal{A}_{n+} \mathcal{A}_{n+}^{*}\left(\boldsymbol{\epsilon}_{+} \times \boldsymbol{\epsilon}_{+}^{*}\right)+\mathcal{A}_{n-} \mathcal{A}_{n-}^{*}\left(\boldsymbol{\epsilon}_{-} \times \boldsymbol{\epsilon}_{-}^{*}\right)-\text { c.c. }\right] \tag{91}
\end{equation*}
$$

Using $\epsilon_{+} \times \epsilon_{+}^{*}=\epsilon_{+} \times \epsilon_{-}=-i \mathbf{u}_{\mathbf{k}}$ and $\epsilon_{-} \times \epsilon_{-}^{*}=i \mathbf{u}_{\mathbf{k}}$

$$
\begin{equation*}
\mathbf{S}=\frac{1}{2} \sum_{n}\left[\left|\alpha_{n+}\right|^{2}-\left|\alpha_{n-}\right|^{2}\right] \mathbf{u}_{\mathbf{k}} \tag{92}
\end{equation*}
$$

with an equally simple interpretation.

## Field quantization

The field is a collection of independent harmonic oscillators. Let us quantify all of them independently, using the Dirac approach. The conjugate classical variables $x_{c}$ and $p_{c}$ should be replaced by two operators $X$ and $P$ (position and momentum operators, dimension also the square root of an action) acting in an infinite dimension Hilbert space, with the commutation rule:

$$
\begin{equation*}
[X, P]=i \hbar \tag{93}
\end{equation*}
$$

## Field quantization

Annihilation and creation operators

$$
\begin{equation*}
a=\frac{1}{\sqrt{2 \hbar}}(X+i P) \tag{94}
\end{equation*}
$$

and

$$
\begin{equation*}
a^{\dagger}=\frac{1}{\sqrt{2 \hbar}}(X-i P) \tag{95}
\end{equation*}
$$

with

$$
\begin{equation*}
\left[a, a^{\dagger}\right]=\mathbb{1} \tag{96}
\end{equation*}
$$

Or

$$
\begin{equation*}
X=\sqrt{\frac{\hbar}{2}}\left(a+a^{\dagger}\right) \tag{97}
\end{equation*}
$$

and

$$
\begin{equation*}
P=i \sqrt{\frac{\hbar}{2}}\left(a^{\dagger}-a\right) \tag{98}
\end{equation*}
$$

## Field quantization

Field quadratures

Define reduced units

$$
\begin{equation*}
X_{0}=\frac{X}{\sqrt{2 \hbar}} \quad \text { and } \quad P_{0}=\frac{P}{\sqrt{2 \hbar}} \tag{99}
\end{equation*}
$$

With these definitions

$$
\begin{gather*}
{\left[X_{0}, P_{0}\right]=\frac{i}{2}} \\
a^{\dagger}=X_{0}-i P_{0}, \quad X_{0}=\frac{a+a^{\dagger}}{2}, \quad P_{0}=i \frac{a^{\dagger}-a}{2} \tag{101}
\end{gather*}
$$

## Field quantization

Hamiltonian

$$
\begin{equation*}
H=\frac{\omega}{2}\left(X^{2}+P^{2}\right)=\hbar \omega\left(X_{0}^{2}+P_{0}^{2}\right) \tag{102}
\end{equation*}
$$

or

$$
\begin{equation*}
H=\frac{\hbar \omega}{4}\left[\left(a+a^{\dagger}\right)^{2}-\left(a^{\dagger}-a\right)^{2}\right] \tag{103}
\end{equation*}
$$

and, in the 'normal order',

$$
\begin{equation*}
H=\hbar \omega\left(a^{\dagger} a+\frac{1}{2}\right) \tag{104}
\end{equation*}
$$

whose diagonaization is described in all textbooks.

## Field quantization

Number operator

$$
\begin{equation*}
N=a^{\dagger} a \tag{105}
\end{equation*}
$$

Commutation relations:

$$
\begin{equation*}
[N, a]=-a \quad \text { and } \quad\left[N, a^{\dagger}\right]=a^{\dagger} \tag{106}
\end{equation*}
$$

Eingenvalues: all positive integers, with nondegenerate eignestates

$$
\begin{equation*}
N|n\rangle=n|n\rangle, \tag{107}
\end{equation*}
$$

Hence, the eigenergies are

$$
\begin{equation*}
E_{n}=\left(n+\frac{1}{2}\right) \hbar \omega \tag{108}
\end{equation*}
$$

Ground state: 'vacuum', $|0\rangle$, energy $\hbar \omega / 2$

## Field quantization

## Fock states

$|n\rangle$ are the 'photon number states' with the orthogonality relation

$$
\begin{equation*}
\langle n \mid p\rangle=\delta_{n, p} \tag{109}
\end{equation*}
$$

Annihilation and creation of photons with:

$$
\begin{equation*}
a|n\rangle=\sqrt{n}|n-1\rangle \tag{110}
\end{equation*}
$$

with

$$
\begin{equation*}
a|0\rangle=0 \tag{111}
\end{equation*}
$$

and, similarly

$$
\begin{equation*}
a^{\dagger}|n\rangle=\sqrt{n+1}|n+1\rangle \tag{112}
\end{equation*}
$$

Hence

$$
\begin{equation*}
|n\rangle=\frac{\left(a^{\dagger}\right)^{n}}{\sqrt{n!}}|0\rangle \tag{113}
\end{equation*}
$$

## Field quantization

All modes

$$
\begin{equation*}
H\left|n_{1}, \ldots, n_{\ell} \ldots\right\rangle=E_{n}\left|n_{1}, \ldots, n_{\ell} \ldots\right\rangle \tag{114}
\end{equation*}
$$

with

$$
\begin{equation*}
E_{n}=\sum_{\ell}\left(n_{\ell} \hbar \omega_{\ell}+\frac{\hbar \omega_{\ell}}{2}\right) \tag{115}
\end{equation*}
$$

and

$$
\begin{equation*}
\left|n_{1}, \ldots, n_{\ell} \ldots\right\rangle=\prod_{\ell} \frac{\left(a_{\ell}^{\dagger}\right)^{n_{\ell}}}{\sqrt{n_{\ell}!}}|0\rangle \tag{116}
\end{equation*}
$$

Note that the vacuum state has an infinite energy (more on that later).

## Field quantization

Vector potential operator
Classical normal variables:

$$
\begin{equation*}
\mathcal{A}=\frac{1}{2 \sqrt{\epsilon_{0} \omega \mathcal{V}}}\left(x_{c}+i p_{c}\right) \tag{117}
\end{equation*}
$$

Corresponding quantum operators

$$
\begin{equation*}
A_{\ell}=\frac{1}{2 \sqrt{\epsilon_{0} \omega_{\ell} \mathcal{V}}}\left(X_{\ell}+i P_{\ell}\right)=\sqrt{\frac{\hbar}{2 \epsilon_{0} \omega_{\ell} \mathcal{V}}} a_{\ell} \tag{118}
\end{equation*}
$$

Positive frequency vector potential

$$
\begin{equation*}
\mathbf{A}^{+}(\mathbf{r})=\sum_{\ell} \sqrt{\frac{\hbar}{2 \epsilon_{0} \omega_{\ell} \mathcal{V}}} a_{\ell} \mathbf{f}_{\ell}(\mathbf{r}) \tag{119}
\end{equation*}
$$

Hermitian vector potential:

$$
\begin{equation*}
\mathbf{A}(\mathbf{r})=\sum_{\ell} \sqrt{\frac{\hbar}{2 \epsilon_{0} \omega_{\ell} \mathcal{V}}}\left(a_{\ell} \mathbf{f}_{\ell}(\mathbf{r})+a_{\ell}^{\dagger} \mathbf{f}_{\ell}^{*}(\mathbf{r})\right) \tag{120}
\end{equation*}
$$

## Field quantization

## Electric field operator

The hermitian electric field is similarly:

$$
\begin{equation*}
\mathbf{E}(\mathbf{r})=i \sum_{\ell} \mathcal{E}_{\ell}\left(a_{\ell} \mathbf{f}_{\ell}(\mathbf{r})-a_{\ell}^{\dagger} \mathbf{f}_{\ell}^{*}(\mathbf{r})\right) \tag{121}
\end{equation*}
$$

where we define the 'field per photon in mode $\ell$ ' by

$$
\begin{equation*}
\mathcal{E}_{\ell}=\sqrt{\frac{\hbar \omega_{\ell}}{2 \epsilon_{0} \mathcal{V}}} \tag{122}
\end{equation*}
$$

## Field quantization

Magnetic field operator

$$
\begin{equation*}
\mathbf{B}(\mathbf{r})=\sum_{\ell} \sqrt{\frac{\hbar}{2 \epsilon_{0} \omega_{\ell} \mathcal{V}}}\left(a_{\ell} \mathbf{h}_{\ell}(\mathbf{r})+a_{\ell}^{\dagger} \mathbf{h}_{\ell}^{*}(\mathbf{r})\right) \tag{123}
\end{equation*}
$$

with $\mathbf{h}_{\ell}=\boldsymbol{\nabla} \times \mathbf{f}_{\ell}$

## Field quantization

Plane wave mode basis

$$
\begin{align*}
\mathbf{A}^{+}(\mathbf{r}) & =\sum_{\ell} \sqrt{\frac{\hbar}{2 \epsilon_{0} \omega_{\ell} \mathcal{V}}} a_{\ell} \boldsymbol{\epsilon}_{\ell} e^{i \mathbf{k}_{\ell} \cdot \mathbf{r}}  \tag{124}\\
\mathbf{E}^{+}(\mathbf{r}) & =i \sum_{\ell} \mathcal{E}_{\ell} a_{\ell} \epsilon_{\ell} e^{i \mathbf{k}_{\ell} \cdot \mathbf{r}}  \tag{125}\\
\mathbf{B}^{+}(\mathbf{r}) & =\sum_{\ell} \sqrt{\frac{\hbar}{2 \epsilon_{0} \omega_{\ell} \mathcal{V}}} a_{\ell}\left(i \mathbf{k}_{\ell} \times \boldsymbol{\epsilon}_{\ell}\right) e^{i \mathbf{k}_{\ell} \cdot \mathbf{r}} \tag{126}
\end{align*}
$$

## Field quantization

Heisenberg picture

Evolution of annihilation operator

$$
\begin{equation*}
i \hbar \frac{d a_{H}}{d t}=\left[a_{H}, H\right] \quad \text { i.e. } \quad \frac{d a_{H}}{d t}=-i \omega a_{H} \tag{127}
\end{equation*}
$$

whose immediate solution is

$$
\begin{equation*}
a_{H}(t)=a_{H}(0) e^{-i \omega t}=a e^{-i \omega t} \tag{128}
\end{equation*}
$$

## Field quantization

Momentum, angular momentum

- Total momentum by replacing $\left|\alpha_{\ell}\right|^{2}$ in the classical expression by $\alpha_{\ell}^{*} \alpha_{\ell}$ and $\alpha_{\ell}$ by $a_{\ell} \sqrt{2 \hbar}$

$$
\begin{equation*}
\mathbf{P}=\sum_{\ell} \hbar \mathbf{k}_{l} a_{\ell}^{\dagger} a_{\ell} \tag{129}
\end{equation*}
$$

- Similarly

$$
\begin{equation*}
\mathbf{S}=\sum_{n} \hbar \mathbf{u}_{\mathbf{k}_{n}}\left[N_{n+}-N_{n-}\right] \tag{130}
\end{equation*}
$$

## Field quantization

Field quadratures
Eigenstates of the quadratures:

$$
\begin{equation*}
X_{0}|x\rangle=x|x\rangle \quad \text { and } \quad P_{0}|p\rangle=p|p\rangle \tag{131}
\end{equation*}
$$

Wavefunctions:

$$
\begin{equation*}
\Psi(x)=\langle x \mid \Psi\rangle \tag{132}
\end{equation*}
$$

For the vacuum:

$$
\begin{equation*}
\Psi_{0}(x)=\left(\frac{2}{\pi}\right)^{1 / 4} e^{-x^{2}} \tag{133}
\end{equation*}
$$

Also in the $|p\rangle$ representation:

$$
\begin{equation*}
\widetilde{\Psi}_{0}(p)=\left(\frac{2}{\pi}\right)^{1 / 4} e^{-p^{2}} \tag{134}
\end{equation*}
$$

Suggests a pictorial representation of the vacuum as a small circle in phase plane.

## Field quantization

Field quadratures

For the Fock state $|n\rangle$ :

$$
\begin{equation*}
\Psi_{n}(x)=\left(\frac{2}{\pi}\right)^{1 / 4} \frac{1}{\sqrt{2^{n} n!}} e^{-x^{2}} H_{n}(x \sqrt{2}) \tag{135}
\end{equation*}
$$

where $H_{n}$ is the $n$th Hermite polynomial defined by

$$
\begin{equation*}
H_{n}(u)=(-1)^{n} e^{u^{2}} \frac{d^{n}}{d u^{n}} e^{-u^{2}} \tag{136}
\end{equation*}
$$

These wavefunctions have $n$ nodes and a a parity $(-1)^{n}$

## Field quantization

Field quadratures
General field quadratures

$$
\begin{equation*}
X_{\phi}=\frac{a e^{-i \phi}+a^{\dagger} e^{i \phi}}{2} \tag{137}
\end{equation*}
$$

Commutation:

$$
\begin{equation*}
\left[X_{\phi}, X_{\phi+\pi / 2}\right]=\frac{i}{2} \tag{138}
\end{equation*}
$$

Heisenberg relations

$$
\begin{equation*}
\Delta X_{\phi} \Delta X_{\phi+\pi / 2} \geq \frac{1}{4} \tag{139}
\end{equation*}
$$

Eigenstates $X_{\phi}\left|x_{\phi}\right\rangle=x_{\phi}\left|x_{\phi}\right\rangle$ with

$$
\begin{equation*}
\left|x_{\phi+\pi / 2}\right\rangle=\frac{1}{\sqrt{\pi}} \int d y_{\phi} e^{2 i x_{\phi+\pi / 2} y_{\phi}}\left|y_{\phi}\right\rangle \tag{140}
\end{equation*}
$$

## Field quantization

Mode basis change
From basis $\mathbf{f}_{\ell}$ to $\mathbf{g}_{p}$, with

$$
\begin{equation*}
\mathbf{f}_{\ell}=\sum_{p} U_{\ell p} \mathbf{g}_{p} \tag{141}
\end{equation*}
$$

where $U_{\ell p}$ is a unitary matrix that connects modes with identical frequencies.
The positive frequency part of the electric field can be written as:

$$
\begin{align*}
\mathbf{E}^{+} & =i \sum_{\ell} \mathcal{E}_{\ell} \mathbf{f}_{\ell}(\mathbf{r}) a_{\ell} \\
& =i \sum_{\ell, p} \mathcal{E}_{\ell} U_{\ell p} a_{\ell} \mathbf{g}_{p}(\mathbf{r}) \\
& =\sum_{p} \mathcal{E}_{p} \mathbf{g}_{p}(\mathbf{r}) b_{p} \tag{142}
\end{align*}
$$

## Field quantization

Mode basis change

Defines the new annihilation operators

$$
\begin{equation*}
b_{p}=\sum_{\ell} U_{\ell p} a_{\ell} \tag{143}
\end{equation*}
$$

and using unitarity $U_{\ell p}^{*}=U_{p \ell}^{\dagger}$

$$
\begin{equation*}
b_{p}^{\dagger}=\sum_{\ell} U_{p l}^{\dagger} a_{\ell}^{\dagger} \tag{144}
\end{equation*}
$$

## Field quantization

Mode basis change

Exercise: check new bosonic commutation rules

$$
\begin{align*}
{\left[b_{p}, b_{q}^{\dagger}\right] } & =\sum_{\ell, m} U_{\ell p} a_{\ell} U_{q m}^{\dagger} a_{m}^{\dagger}-U_{q m}^{\dagger} a_{m}^{\dagger} U_{\ell p} a_{\ell} \\
& =\sum_{\ell, m} U_{\ell p} U_{q m}^{\dagger}\left[a_{\ell}, a_{m}^{\dagger}\right] \\
& =\sum_{\ell} U_{q \ell}^{\dagger} U_{\ell p} \\
& =\delta_{p, q} \tag{145}
\end{align*}
$$

## Fock states

A basis of the Hilbert space

$$
\begin{equation*}
|\Psi\rangle=\sum_{n} c_{n}|n\rangle \tag{146}
\end{equation*}
$$

Photon number distribution

$$
\begin{equation*}
p_{n}=\left|c_{n}\right|^{2} \tag{147}
\end{equation*}
$$

Mean number of photons

$$
\begin{equation*}
\bar{n}=\sum_{n} n p_{n} \tag{148}
\end{equation*}
$$

Photon number variance

$$
\begin{align*}
\Delta N^{2} & =\left\langle N^{2}\right\rangle-\langle N\rangle^{2} \\
& =\sum_{n}(n-\bar{n})^{2} p_{n} \tag{149}
\end{align*}
$$

## Fock states

Statistical mixtures

$$
\begin{equation*}
\rho=\sum_{n, p} \rho_{n p}|n\rangle\langle p| \tag{150}
\end{equation*}
$$

Photon number distribution

$$
\begin{equation*}
\rho_{n n}=p_{n} \tag{151}
\end{equation*}
$$

Note that Fock states are not invariant in a mode basis change

$$
\begin{equation*}
\left|n_{p}\right\rangle=\frac{\left(b_{p}^{\dagger}\right)^{n_{p}}}{\sqrt{n!}}|0\rangle=\frac{\left(\sum_{\ell} U_{p \ell}^{\dagger} a_{\ell}^{\dagger}\right)^{n_{p}}}{\sqrt{n!}}|0\rangle \tag{152}
\end{equation*}
$$

## Fock states

Non classicality of Fock states

Fock states are very non-classical

- A large energy
- Zero average fields and potentials since $\langle n| a|n\rangle=0$

Can we find more intuitive field states? Yes: Coherent states.

## Coherent states

Displacement operator

A unitary defined by:

$$
\begin{equation*}
D(\alpha)=e^{\alpha a^{\dagger}-\alpha^{*} a} \tag{153}
\end{equation*}
$$

where $\alpha$ is an arbitrary complex amplitude

$$
\begin{gather*}
\alpha=\alpha^{\prime}+i \alpha^{\prime \prime}  \tag{154}\\
D(\alpha)^{\dagger} D(\alpha)=\mathbb{1} \tag{155}
\end{gather*}
$$

and

$$
\begin{equation*}
D(\alpha)^{\dagger}=D(-\alpha) \tag{156}
\end{equation*}
$$

## Coherent states

Displacement operator
An equivalent expression

$$
\begin{equation*}
D(\alpha)=e^{2 i \alpha^{\prime \prime} X_{0}-2 i \alpha^{\prime} P_{0}} \tag{157}
\end{equation*}
$$

Using the Glauber relation

$$
\begin{equation*}
e^{A} e^{B}=e^{A+B} e^{[A, B] / 2} \tag{158}
\end{equation*}
$$

valid when

$$
\begin{gather*}
{[A,[A, B]]=[B,[A, B]]=0}  \tag{159}\\
D(\alpha)=e^{-i \alpha^{\prime} \alpha^{\prime \prime}} e^{2 i \alpha^{\prime \prime} X_{0}} e^{-2 i \alpha^{\prime} P_{0}} \tag{160}
\end{gather*}
$$

a product of displacement operators:

$$
\begin{align*}
e^{-2 i \alpha^{\prime} P_{0}}|x\rangle & =\left|x+\alpha^{\prime}\right\rangle  \tag{161}\\
e^{2 i \alpha^{\prime \prime} X_{0}}|p\rangle & =\left|p+\alpha^{\prime \prime}\right\rangle \tag{162}
\end{align*}
$$

## Coherent states

Combination of displacements

Using Glauber

$$
\begin{equation*}
D(\alpha) D(\beta)=e^{\left(\alpha \beta^{*}-\alpha^{*} \beta\right) / 2} D(\alpha+\beta) \tag{163}
\end{equation*}
$$

Note that

$$
\begin{equation*}
\Phi=\left(\alpha \beta^{*}-\alpha^{*} \beta\right) / 2 i=\frac{\alpha^{\prime \prime} \beta^{\prime}-\alpha^{\prime} \beta^{\prime \prime}}{2} \tag{164}
\end{equation*}
$$

surface of the triangle with sides $\alpha$ and $\beta$.

## Coherent states

Displacement of annihilation

Compute $D(-\alpha) a D(\alpha)$. Use Baker-Hausdorff lemma

$$
\begin{equation*}
e^{A} a e^{-A}=a+[A, a]+\frac{1}{2!}[A,[A, a]]+\ldots \tag{165}
\end{equation*}
$$

for $A=-\alpha a^{\dagger}+\alpha^{*} a$, with $[A, a]=\alpha$. Hence

$$
\begin{equation*}
D(-\alpha) a D(\alpha)=a+\alpha \mathbb{1} \tag{166}
\end{equation*}
$$

## Coherent states

## Definition

The coherent states are defined as

$$
\begin{equation*}
|\alpha\rangle=D(\alpha)|0\rangle . \tag{167}
\end{equation*}
$$

Note that $|0\rangle$ is a coherent state. Coherent states in general are the vacuum displaced by the complex amplitude $\alpha$.
Wavefunction of a coherent state in the $X_{0}$ representation:

$$
\begin{equation*}
\Psi_{\alpha}(x) \propto e^{-\left(x-\alpha^{\prime}\right)^{2}} \tag{168}
\end{equation*}
$$

and in the $P_{0}$ representation:

$$
\begin{equation*}
\widetilde{\Psi}_{\alpha}(p) \propto e^{-\left(p-\alpha^{\prime \prime}\right)^{2}} \tag{169}
\end{equation*}
$$

## Coherent states

Properties

- Right-eigenstates of the annihilation operator

$$
\begin{equation*}
a|\alpha\rangle=a D(\alpha)|0\rangle=D(\alpha) D(-\alpha) a D(\alpha)|0\rangle=(a+\alpha \mathbb{1})|0\rangle=\alpha|\alpha\rangle \tag{170}
\end{equation*}
$$

since $a|0\rangle=0$. Hence

$$
\begin{equation*}
\langle\alpha| a|\alpha\rangle=\alpha \quad \text { and } \quad\langle\alpha| a^{\dagger}|\alpha\rangle=\alpha^{*} \tag{171}
\end{equation*}
$$

- Field operators have nonzero eigenvalues in the coherent states:

$$
\begin{align*}
\langle\mathbf{E}\rangle & =i \mathcal{E}\left(\mathbf{f}(\mathbf{r}) \alpha-\mathbf{f}^{*}(\mathbf{r}) \alpha^{*}\right)  \tag{172}\\
\langle\mathbf{A}\rangle & =\frac{\mathcal{E}}{\omega}\left(\mathbf{f}(\mathbf{r}) \alpha+\mathbf{f}^{*}(\mathbf{r}) \alpha^{*}\right) \tag{173}
\end{align*}
$$

## Coherent states

Properties

- Average photon number

$$
\begin{equation*}
\bar{n}=\langle\alpha| a^{\dagger} a|\alpha\rangle=|\alpha|^{2} \tag{174}
\end{equation*}
$$

- Photon number variance. Using $N^{2}=a^{\dagger} a a^{\dagger} a=\left(a^{\dagger}\right)^{2} a^{2}+a^{\dagger} a$

$$
\begin{equation*}
\left\langle N^{2}\right\rangle=|\alpha|^{4}+|\alpha|^{2} \tag{175}
\end{equation*}
$$

and

$$
\begin{gather*}
\Delta N^{2}=|\alpha|^{2}=\bar{n}  \tag{176}\\
\frac{\Delta N}{\bar{n}}=\frac{1}{\sqrt{\bar{n}}} \tag{177}
\end{gather*}
$$

## Coherent states

Properties

- Expansion on the Fock state basis

$$
\begin{equation*}
D(\alpha)=e^{-|\alpha|^{2} / 2} e^{\alpha a^{\dagger}} e^{-\alpha^{*} a} \tag{178}
\end{equation*}
$$

with $a|0\rangle=0$ :

$$
\begin{equation*}
|\alpha\rangle=e^{-|\alpha|^{2} / 2} e^{\alpha a^{\dagger}}|0\rangle \tag{179}
\end{equation*}
$$

Expand exponential:

$$
\begin{equation*}
|\alpha\rangle=\sum_{n} c_{n}|n\rangle \tag{180}
\end{equation*}
$$

with

$$
\begin{equation*}
c_{n}=e^{-|\alpha|^{2} / 2} \frac{\alpha^{n}}{\sqrt{n!}} \tag{181}
\end{equation*}
$$

## Coherent states

Properties

- Photon number distribution

$$
\begin{equation*}
p_{n}=e^{-|\alpha|^{2}} \frac{|\alpha|^{2 n}}{n!}=e^{-\bar{n}} \frac{\bar{n}^{n}}{n!} \tag{182}
\end{equation*}
$$

For large average photon numbers

$$
\begin{equation*}
p_{n} \propto e^{-(n-\bar{n})^{2} / \bar{n}} \tag{183}
\end{equation*}
$$

- Scalar product of coherent states

$$
\begin{align*}
\langle\alpha \mid \beta\rangle & =e^{-\left(|\alpha|^{2}+|\beta|^{2}\right) / 2} \sum_{n, p} \frac{\left(\alpha^{*}\right)^{n} \beta^{p}}{\sqrt{n!p!}}\langle n \mid p\rangle \\
& =e^{-\left(|\alpha|^{2}+|\beta|^{2}\right) / 2} e^{\alpha^{*} \beta} \tag{184}
\end{align*}
$$

Square modulus

$$
\begin{equation*}
|\langle\alpha \mid \beta\rangle|^{2}=e^{-|\alpha-\beta|^{2}} \tag{185}
\end{equation*}
$$

## Coherent states

Properties

- Overcomplete basis

$$
\begin{equation*}
\mathbb{1}=\frac{1}{\pi} \int d^{2} \alpha|\alpha\rangle\langle\alpha| \tag{186}
\end{equation*}
$$

Demonstration:

$$
\begin{equation*}
\int d^{2} \alpha|\alpha\rangle\langle\alpha|=\sum_{n, p} \frac{1}{\sqrt{n!p!}}|n\rangle\langle p| \int d^{2} \alpha e^{-|\alpha|^{2}} \alpha^{n}\left(\alpha^{*}\right)^{p} \tag{187}
\end{equation*}
$$

Switch to polar coordinates $\alpha=\rho \exp (i \theta)$

$$
\begin{equation*}
\int \rho d \rho d \theta e^{-\rho^{2}} \rho^{n+p} e^{i \theta(n-p)} \tag{188}
\end{equation*}
$$

Cancels when $n \neq p$.

## Coherent states

Properties

- Overcomplete basis

For $n=p$

$$
\begin{equation*}
I_{n}=\pi \int d u u^{n} e^{-u} \tag{189}
\end{equation*}
$$

with $u=\rho^{2}$. Integration per parts leads to $I_{n}=n I_{n-1}$ and $I_{n}=\pi n$ !. Hence

$$
\begin{equation*}
\int d^{2} \alpha|\alpha\rangle\langle\alpha|=\pi \sum_{n}|n\rangle\langle n| \tag{190}
\end{equation*}
$$

## Coherent states

Properties

- Overcomplete basis Expansion is not uniquely defined:

$$
\begin{equation*}
|0\rangle=\frac{1}{\pi} \int d^{2} \alpha e^{-|\alpha|^{2} / 2}|\alpha\rangle \tag{191}
\end{equation*}
$$

and

$$
\begin{equation*}
|n\rangle=\frac{1}{\pi \sqrt{n!}} \int d^{2} \alpha e^{-|\alpha|^{2} / 2}\left(\alpha^{*}\right)^{n}|\alpha\rangle \tag{192}
\end{equation*}
$$

## Coherent states

Properties

- Evolution

$$
\begin{align*}
& |\Psi(0)\rangle=|\alpha\rangle=e^{-|\alpha|^{2} / 2} \sum_{n} \frac{\alpha^{n}}{\sqrt{n!}}|n\rangle  \tag{193}\\
& |\Psi(t)\rangle=e^{-|\alpha|^{2} / 2} \sum_{n} \frac{\alpha^{n}}{\sqrt{n!}} e^{-i n \omega t} e^{-i \omega t / 2}|n\rangle \\
& =e^{-i \omega t / 2}\left|\alpha e^{-i \omega t}\right\rangle \tag{194}
\end{align*}
$$

Evolution of the amplitude is the same as in classical physics

$$
\begin{equation*}
\alpha(t)=\alpha(0) e^{-i \omega t} \tag{195}
\end{equation*}
$$

## Phase space representations

Seeks an analogue of the classical phase space distributions $f(x, p)$ of statistical physics allowing us to compute any average by

$$
\begin{equation*}
\bar{o}=\int f(x, p) o(x, p) d x d p \tag{196}
\end{equation*}
$$

Transpose that to a field statistical mixture defined by the density operator $\rho$.

## Phase space representations

Characteristic functions

Three operators ordering:

- Normal: a on right. e.g. number operator $a^{\dagger} a$
- Symmetric e.g. $\left(a a^{\dagger}+a^{\dagger} a\right)$
- Anti-Normal e.g. $a^{\dagger}{ }^{\dagger}$

Any operator expression can be put in one of these forms by proper commutations of creation and annihilation operators.
Leads to three characteristic functions characterizing $\rho$

## Phase space representations

## Symmetric characteristic function

- Symmetric characteristic function

$$
\begin{equation*}
C_{s}^{[\rho]}(\lambda)=\langle D(\lambda)\rangle=\operatorname{Tr}\left[\rho e^{\lambda a^{\dagger}-\lambda^{*} a}\right] \tag{197}
\end{equation*}
$$

with

$$
\begin{equation*}
C_{s}^{[\rho]}(0)=\operatorname{Tr}(\rho)=1 \tag{198}
\end{equation*}
$$

$D$ being unitary, all its eigenvalues have a unit modulus. Hence

$$
\begin{equation*}
\left|C_{s}^{[\rho]}(\lambda)\right| \leq 1 \tag{199}
\end{equation*}
$$

and

$$
\begin{equation*}
C_{s}^{[\rho]}(-\lambda)=\left[C_{s}^{[\rho]}(\lambda)\right]^{*} \tag{200}
\end{equation*}
$$

For a pure state

$$
\begin{equation*}
C_{s}^{[|\Psi\rangle\langle\Psi|]}=\langle\Psi| D(\lambda)|\Psi\rangle \tag{201}
\end{equation*}
$$

## Phase space representations

Normal and anti-normal characteristic functions

- Normal characteristic function

$$
\begin{equation*}
C_{n}^{[\rho]}(\lambda)=\operatorname{Tr}\left[\rho e^{\lambda a^{\dagger}} e^{-\lambda^{*} a}\right] \tag{202}
\end{equation*}
$$

- Anti-normal characteristic function

$$
\begin{equation*}
C_{a n}^{[\rho]}(\lambda)=\operatorname{Tr}\left[\rho e^{-\lambda^{*} a} e^{\lambda a^{\dagger}}\right] \tag{203}
\end{equation*}
$$

- Relations

$$
\begin{equation*}
C_{n}^{[\rho]}(\lambda)=e^{|\lambda|^{2} / 2} C_{s}^{[\rho]}(\lambda) \quad C_{a n}^{[\rho]}(\lambda)=e^{-|\lambda|^{2} / 2} C_{s}^{[\rho]}(\lambda) \tag{204}
\end{equation*}
$$

## Phase space representations

The Husimi- $Q$ representation

Definition:

$$
\begin{equation*}
Q^{[\rho]}(\alpha)=\frac{1}{\pi^{2}} \int d^{2} \lambda e^{\left(\alpha \lambda^{*}-\alpha^{*} \lambda\right)} C_{a n}^{[\rho]}(\lambda) \tag{205}
\end{equation*}
$$

After some algebra:

$$
\begin{equation*}
Q^{[\rho]}(\alpha)=\frac{1}{\pi} \operatorname{Tr}[\rho|\alpha\rangle\langle\alpha|]=\frac{1}{\pi}\langle\alpha| \rho|\alpha\rangle=\frac{1}{\pi} \operatorname{Tr}[|0\rangle\langle 0| D(-\alpha) \rho D(\alpha)] \tag{206}
\end{equation*}
$$

The $Q$ distribution is positive, bounded by $1 / \pi$ and normalized $\left(\int d^{2} \alpha Q(\alpha)=1\right)$.

## Phase space representations

The Husimi- $Q$ representation

A few states

- Coherent state $|\beta\rangle$

$$
\begin{equation*}
Q^{[|\beta\rangle\langle\beta|]}(\alpha)=\frac{1}{\pi}|\langle\alpha \mid \beta\rangle|^{2}=\frac{1}{\pi} e^{-|\alpha-\beta|^{2}} \tag{207}
\end{equation*}
$$

- Fock state $|n\rangle$

$$
\begin{equation*}
Q^{[|n\rangle\langle n|]}(\alpha)=\frac{1}{\pi} \frac{|\alpha|^{2 n}}{n!} e^{-|\alpha|^{2}} \tag{208}
\end{equation*}
$$

## Phase space representations

The Husimi- $Q$ representation

- Cat state

$$
\begin{equation*}
\left|\Psi_{\text {cat }}^{ \pm}\right\rangle=\frac{1}{\sqrt{\mathcal{N}_{ \pm}}}(|\beta\rangle \pm|-\beta\rangle) \tag{209}
\end{equation*}
$$

where:

$$
\begin{equation*}
\mathcal{N}_{ \pm}=2\left(1 \pm e^{-2|\beta|^{2}}\right) \tag{210}
\end{equation*}
$$

$$
\begin{equation*}
Q^{[\mathrm{cat}, \pm]}(\alpha)=\frac{1}{\pi \mathcal{N}_{ \pm}}\left[e^{-|\alpha-\beta|^{2}}+e^{-|\alpha+\beta|^{2}} \pm 2 e^{-\left(|\alpha|^{2}+|\beta|^{2}\right)} \cos \left(2 \beta \alpha^{\prime \prime}\right)\right] \tag{211}
\end{equation*}
$$

## Phase space representations

The Husimi- $Q$ representation

(a) Coherent state $|\beta\rangle$, with $\beta=\sqrt{5}$. (b) Five-photon Fock state. (c) Schrödinger cat state, superposition of two coherent fields $| \pm \beta\rangle$, with $\beta=\sqrt{5}$. (d) Statistical mixture of the same coherent components.

## Phase space representations

The Wigner function

Definition:

$$
\begin{equation*}
W(\alpha)=\frac{1}{\pi^{2}} \int d^{2} \lambda C_{s}(\lambda) e^{\alpha \lambda^{*}-\alpha^{*} \lambda} \tag{212}
\end{equation*}
$$

After a long derivation (see complete lecture notes)

$$
\begin{equation*}
W(x, p)=\frac{2}{\pi} \operatorname{Tr}[D(-\alpha) \rho D(\alpha) \mathcal{P}] \tag{213}
\end{equation*}
$$

where the unitary parity operator $\mathcal{P}$ is defined by

$$
\begin{equation*}
\mathcal{P}|x\rangle=|-x\rangle ; \quad \mathcal{P}|p\rangle=|-p\rangle \tag{214}
\end{equation*}
$$

## Phase space representations

The Wigner function

Properties of parity operator

$$
\begin{equation*}
\mathcal{P}|n\rangle=(-1)^{n}|n\rangle \tag{215}
\end{equation*}
$$

and hence

$$
\begin{equation*}
\mathcal{P}=e^{i \pi a^{\dagger} a} \tag{216}
\end{equation*}
$$

The modulus of its average is lower than one. Thus

$$
\begin{equation*}
-2 / \pi \leq W(\alpha) \leq 2 / \pi \tag{217}
\end{equation*}
$$

## Phase space representations

## The Wigner function

Marginals of the Wigner distribution:

$$
\begin{equation*}
P(x)=\langle x| \rho|x\rangle=\int d p W(x, p) \tag{218}
\end{equation*}
$$

and

$$
\begin{equation*}
P(p)=\langle p| \rho|p\rangle=\int d x W(x, p) \tag{219}
\end{equation*}
$$

More generally,

$$
\begin{equation*}
P\left(p_{\phi}\right)=\int d x_{\phi} W\left(x_{\phi}, p_{\phi}\right) \tag{220}
\end{equation*}
$$

with

$$
\begin{equation*}
x_{\phi}=x \cos \phi+p \sin \phi ; \quad p_{\phi}=-x \sin \phi+p \cos \phi \tag{221}
\end{equation*}
$$

## Phase space representations

The Wigner function

The average of any operator can be directly obtained from the Wigner function

$$
\begin{equation*}
\langle O\rangle=\int d x d p W(x, p) o_{s}(x, p) \tag{222}
\end{equation*}
$$

where $o_{s}$ is the symmetrized form of the operator $O$ in terms of the field quadratures.

## Phase space representations

The Wigner function

A few states

- Coherent state

$$
\begin{equation*}
W^{[|\beta\rangle\langle\beta|]}(\alpha)=\frac{2}{\pi} e^{-2|\beta-\alpha|^{2}} \tag{223}
\end{equation*}
$$

- Thermal field

$$
\begin{equation*}
W^{\left[\rho_{\mathrm{th}}\right]}(\alpha)=\frac{2}{\pi} \frac{1}{2 n_{\mathrm{th}}+1} e^{-2|\alpha|^{2} /\left(2 n_{\mathrm{th}}+1\right)} \tag{224}
\end{equation*}
$$

## Phase space representations

The Wigner function

- Squeezed vacuum $S(\xi)|0\rangle$ with

$$
\begin{equation*}
S(\xi)=e^{\left(\xi^{*} a^{2}-\xi a^{\dagger^{2}}\right) / 2} \tag{225}
\end{equation*}
$$

Reduced fluctuations on $X_{0}$

$$
\begin{equation*}
\Delta X_{0}=\frac{1}{2} e^{-\xi} \tag{226}
\end{equation*}
$$

and

$$
\begin{gather*}
\Delta P_{0}=\frac{1}{2} e^{\xi}  \tag{227}\\
W^{[s q, \xi]}(x, p)=\frac{2}{\pi} e^{-2 \exp (2 \xi) x^{2}} e^{-2 \exp (-2 \xi) p^{2}} \tag{228}
\end{gather*}
$$

## Phase space representations

The Wigner function

(a) Vacuum state. (b) Coherent state with $\beta=\sqrt{5}$. (c) Thermal field with $n_{\text {th }}=1$ photon on the average. (d) A squeezed vacuum state, with a squeezing parameter $\xi=0.5$.

## Phase space representations

The Wigner function

- Fock state

$$
\begin{equation*}
W^{[|n\rangle\langle n|]}(\alpha)=\frac{2}{\pi}(-1)^{n} e^{-2|\alpha|^{2}} \mathcal{L}_{n}\left(4|\alpha|^{2}\right) \tag{229}
\end{equation*}
$$

with

$$
\begin{gather*}
W^{[|n\rangle\langle n|]}(0)=\frac{2}{\pi}(-1)^{n}  \tag{230}\\
W^{[|1\rangle\langle 1|]}(\alpha)=-\frac{2}{\pi}\left(1-4|\alpha|^{2}\right) e^{-2|\alpha|^{2}} \tag{231}
\end{gather*}
$$

## Phase space representations

The Wigner function

Wigner function of a five-photon Fock state.

## Phase space representations

The Wigner function

- Cat state

$$
\begin{align*}
W^{[\text {cat }, \pm]}(\alpha) & =\frac{1}{\pi\left(1 \pm e^{-2|\beta|^{2}}\right)}\left[e^{-2|\alpha-\beta|^{2}}+e^{-2|\alpha+\beta|^{2}}\right. \\
& \left. \pm 2 e^{-2|\alpha|^{2}} \cos \left(4 \alpha^{\prime \prime} \beta\right)\right] \tag{232}
\end{align*}
$$

## Phase space representations

The Wigner function

Wigner functions of even (a) and odd (b) 10-photon $\pi$-phase cats. The Wigner function provides a clear depiction of the non-classical features of a quantum state.

## Beamsplitter

Coupling field modes

A simple model for coupling two modes of the radiation field

## Beamsplitter

## Classical model

Transformation of the electric field amplitudes

$$
\binom{E_{a}^{\prime}}{E_{b}^{\prime}}=U_{c}\binom{E_{a}}{E_{b}}=\left(\begin{array}{ll}
t(\omega) & r(\omega)  \tag{233}\\
r(\omega) & t(\omega)
\end{array}\right)\binom{E_{a}}{E_{b}}
$$

where the unitary $U_{c}$ can also be written in a simple case as

$$
U_{c}(\theta)=\left(\begin{array}{cc}
\cos (\theta / 2) & i \sin (\theta / 2)  \tag{234}\\
i \sin (\theta / 2) & \cos (\theta / 2)
\end{array}\right)
$$

## Quantum beamsplitter

Hamiltonian model

Model the beamsplitter action as a transient application of the Hamiltonian

$$
\begin{equation*}
H_{a b}(t)=-\hbar \frac{g(t)}{2}\left(a b^{\dagger}+a^{\dagger} b\right) \tag{235}
\end{equation*}
$$

$a$ and $b$ : annihilation operators; $g(t)$ slowly varying real function

## Quantum beamsplitter

Heisenberg point of view
Transformation of the annihilation operator:

$$
\begin{equation*}
a^{\prime}=U^{\dagger} a U \tag{236}
\end{equation*}
$$

where

$$
\begin{equation*}
U=e^{-(i / \hbar) \int H_{a b}(t) d t}=e^{-i G \theta / 2} \tag{237}
\end{equation*}
$$

with

$$
\begin{equation*}
G=-\left(a b^{\dagger}+a^{\dagger} b\right) \quad \text { and } \quad \theta=\int g(t) d t \tag{238}
\end{equation*}
$$

Using Baker-Hausdorff

$$
\begin{aligned}
a^{\prime}= & U^{\dagger} a U=e^{i G \theta / 2} a e^{-i G \theta / 2}=a+\frac{i \theta}{2}[G, a] \\
& +\frac{i^{2} \theta^{2}}{2!2^{2}}[G,[G, a]]+\cdots+\frac{i^{n} \theta^{n}}{n!2^{n}}[G,[G,[\cdots,[G, a]]]]+\cdots(239)
\end{aligned}
$$

## Quantum beamsplitter

Heisenberg point of view

With $[G, a]=b$ and $[G,[G, a]]=a$, series sum up to

$$
\begin{equation*}
a^{\prime}=U^{\dagger} a U=\cos (\theta / 2) a+i \sin (\theta / 2) b \tag{240}
\end{equation*}
$$

and similarly:

$$
\begin{equation*}
b^{\prime}=U^{\dagger} b U=i \sin (\theta / 2) a+\cos (\theta / 2) b \tag{241}
\end{equation*}
$$

Noting that $U^{\dagger}(\theta)=U(-\theta)$
$U a^{\dagger} U^{\dagger}=\cos (\theta / 2) a^{\dagger}+i \sin (\theta / 2) b^{\dagger} ; \quad U b^{\dagger} U^{\dagger}=i \sin (\theta / 2) a^{\dagger}+\cos (\theta / 2) b^{\dagger}$

## Quantum beamsplitter

## State transformations

Transformation of some simple states:

- No photon: $|\Psi\rangle=|0,0\rangle$. This state is obviously invariant
- One photon in mode a

$$
\begin{equation*}
U|1,0\rangle=U a^{\dagger}|0,0\rangle=U a^{\dagger} U^{\dagger} U|0,0\rangle=U a^{\dagger} U^{\dagger}|0,0\rangle \tag{243}
\end{equation*}
$$

and, using the Heisenberg point of view results in:

$$
\begin{align*}
U|1,0\rangle & =\left[\cos (\theta / 2) a^{\dagger}+i \sin (\theta / 2) b^{\dagger}\right]|0,0\rangle \\
& =\cos (\theta / 2)|1,0\rangle+i \sin (\theta / 2)|0,1\rangle \tag{244}
\end{align*}
$$

- One photon in mode $b$

$$
\begin{align*}
U|0,1\rangle & =\left[i \sin (\theta / 2) a^{\dagger}+\cos (\theta / 2) b^{\dagger}\right]|0,0\rangle \\
& =i \sin (\theta / 2)|1,0\rangle+\cos (\theta / 2)|0,1\rangle \tag{245}
\end{align*}
$$

## Quantum beamsplitter

State transformations

- $n$ photons

$$
\begin{equation*}
U|n, 0\rangle=U \frac{\left(a^{\dagger}\right)^{n}}{\sqrt{n!}}|0,0\rangle=\frac{1}{\sqrt{n!}} U\left(a^{\dagger}\right)^{n} U^{\dagger} U|0,0\rangle \tag{246}
\end{equation*}
$$

With $U\left(a^{\dagger}\right)^{n} U^{\dagger}=\left(U a^{\dagger} U^{\dagger}\right)^{n}$,

$$
\begin{equation*}
U|n, 0\rangle=\frac{1}{\sqrt{n!}}\left[\cos \frac{\theta}{2} a^{\dagger}+i \sin \frac{\theta}{2} b^{\dagger}\right]^{n}|0,0\rangle \tag{247}
\end{equation*}
$$

expansion of the r.h.s.

$$
\begin{equation*}
U|n, 0\rangle=\sum_{p=0}^{n}\binom{n}{p}^{1 / 2}[\cos (\theta / 2)]^{n-p}[i \sin (\theta / 2)]^{p}|n-p, p\rangle \tag{248}
\end{equation*}
$$

## Quantum beamsplitter

State transformations

- $n$ photons, balanced splitter $(\theta=\pi / 2)$

$$
\begin{equation*}
U(\pi / 2,0)|n, 0\rangle=\frac{1}{\sqrt{2^{n}}} \sum_{p=0}^{n}\binom{n}{p}^{1 / 2}(i)^{p}|n-p, p\rangle \tag{249}
\end{equation*}
$$

- Random output selection for each photon
- A massively entangled state of the two output modes

## Quantum beamsplitter

## State transformations

- Coherent state $|\alpha\rangle$

$$
\begin{equation*}
U|\alpha, 0\rangle=U D_{a}(\alpha) U^{\dagger}|0,0\rangle \tag{250}
\end{equation*}
$$

rewrites, with $U f(A) U^{\dagger}=f\left(U A U^{\dagger}\right)$

$$
\begin{equation*}
U D(\alpha) U^{\dagger}=e^{\alpha U a^{\dagger} U^{\dagger}-\alpha^{*} U a U^{\dagger}} \tag{251}
\end{equation*}
$$

and

$$
\begin{equation*}
U|\alpha, 0\rangle=D_{a}[\alpha \cos (\theta / 2)] D_{b}[i \alpha \sin (\theta / 2)]|0,0\rangle \tag{252}
\end{equation*}
$$

finally

$$
\begin{equation*}
U|\alpha, 0\rangle=|\alpha \cos (\theta / 2), i \alpha \sin (\theta / 2)\rangle \tag{253}
\end{equation*}
$$

An unentangled states, with two coherent amplitudes split according to the classical laws.

## Quantum beamsplitter

State transformations

- Photon collision on a beamsplitter

$$
\begin{equation*}
U|1,1\rangle=U a^{\dagger} b^{\dagger}|0,0\rangle=U a^{\dagger} U^{\dagger} U b^{\dagger} U^{\dagger}|0,0\rangle \tag{254}
\end{equation*}
$$

Hence:

$$
\begin{equation*}
U|1,1\rangle=\frac{i \sin \theta}{\sqrt{2}}[|2,0\rangle+|0,2\rangle]+\cos \theta|1,1\rangle \tag{255}
\end{equation*}
$$

which is, in general, an entangled state. Balanced beam-splitter ( $\theta=\pi / 2$ ):

$$
\begin{equation*}
U(\pi / 2,0)|1,1\rangle=(|2,0\rangle+|0,2\rangle) / \sqrt{2} \tag{256}
\end{equation*}
$$

Photon bunching due to their bosonic nature.

## Relaxation

Jump operators

Learn how to treat the coupling of a field mode to the external world. Examples of physical situations

- Propagation of a beam in a diffusive medium
- Field in a cavity with output coupling (laser)
- Field in a box with imperfect conductivity (real cavity)

## Relaxation

Jump operators
Only two possible jump operators at finite temperature $T$

- $L_{-}=\sqrt{\kappa_{-}}$a: loss of a photon in the environment (even when $T=0$ )
- $L+-=\sqrt{\kappa_{+}} a^{\dagger}$ : creation of a thermal excitation

Jump rates linked to the temperature of the environment

$$
\begin{equation*}
\kappa_{+}=\kappa_{-} e^{-\hbar \omega / k_{b} T} \tag{257}
\end{equation*}
$$

Using

$$
\begin{equation*}
n_{\mathrm{th}}=\frac{1}{e^{\hbar \omega / k_{\mathrm{b}} T}-1} \tag{258}
\end{equation*}
$$

we get

$$
\begin{equation*}
\frac{\kappa_{-}}{\kappa_{+}}=\frac{1+n_{\mathrm{th}}}{n_{\mathrm{th}}} \tag{259}
\end{equation*}
$$

and write

$$
\begin{equation*}
\kappa_{-}=\kappa\left(1+n_{\mathrm{th}}\right) ; \quad \kappa_{+}=\kappa n_{\mathrm{th}} \tag{260}
\end{equation*}
$$

## Relaxation

## Lindblad equation

$$
\begin{align*}
\frac{d \rho}{d t}= & -i \omega_{c}\left[a^{\dagger} a, \rho\right]-\frac{\kappa\left(1+n_{\mathrm{th}}\right)}{2}\left(a^{\dagger} a \rho+\rho a^{\dagger} a-2 a \rho a^{\dagger}\right) \\
& -\frac{\kappa n_{\mathrm{th}}}{2}\left(a a^{\dagger} \rho+\rho a a^{\dagger}-2 a^{\dagger} \rho a\right) \tag{261}
\end{align*}
$$

where we have discarded the vacuum energy. Note that all of the Hamiltonian part can be removed by an interaction representation (relaxation terms unchanged). For the photon number distribution:

$$
\begin{align*}
\frac{d p(n)}{d t}= & \kappa\left(1+n_{\mathrm{th}}\right)(n+1) p(n+1)+\kappa n_{\mathrm{th}} n p(n-1) \\
& -\left[\kappa\left(1+n_{\mathrm{th}}\right) n+\kappa n_{\mathrm{th}}(n+1)\right] p(n) \tag{262}
\end{align*}
$$

## Relaxation

Thermal equilibrium

## Detailed balance argument

$$
\begin{equation*}
\kappa\left(1+n_{\mathrm{th}}\right) n p(n)=\kappa n_{\mathrm{th}} n p(n-1) \tag{263}
\end{equation*}
$$

leading to:

$$
\begin{equation*}
\frac{p(n)}{p(n-1)}=\frac{n_{\mathrm{th}}}{1+n_{\mathrm{th}}}=e^{-\hbar \omega / k_{b} T} \tag{264}
\end{equation*}
$$

The expected Maxwell equilibrium

## Relaxation

Fock states

At $T=0$, relaxation of a Fock state

- Jump : removal of a photon
- No jump: non hermitian Hamiltonian

$$
\begin{equation*}
H_{e}=-i \hbar J=-i \hbar \kappa a^{\dagger} a / 2 \tag{265}
\end{equation*}
$$

Leaves photon number states invariant

## Relaxation

Fock states

Relaxation of a 10-photon Fock state.

## Relaxation

## Coherent state

Monte Carlo trajectory

- Jump: no evolution since $|\alpha\rangle$ is an eingenstate of a
- No jumps: evolution with non hermitian hamiltonian, equivalent to a complex mode frequency

$$
\begin{equation*}
|\beta\rangle \rightarrow\left|\beta e^{-\kappa \tau / 2}\right\rangle \tag{266}
\end{equation*}
$$

A coherent state remains coherent, with an exponentially damped amplitude.

## Relaxation

## Coherent state

No change of the photon number in a quantum jump ? A bayesian argument. $p(n \mid c)$ photon number distribution before the jump knowing that a jump occurs ('click' in the environment.) With

$$
\begin{gather*}
p(n, c)=p(c \mid n) p(n)=p(n \mid c) p_{c}  \tag{267}\\
p(n \mid c)=p(n) \frac{p(c \mid n)}{p_{c}}=\frac{n}{\bar{n}} p(n)=e^{-\bar{n}} \frac{\bar{n}^{n-1}}{(n-1)!}=p(n-1) \tag{268}
\end{gather*}
$$

A translated Poisson distribution with $\bar{n}+1$ photons on the average. After jump photon number unchanged. Explains why the photon number distribution is invariant in a jump. Specific property of coherent states.
